

Constrained Reality Framework

Phase 3: Direct Pointing

Ougit Jarittum March 2026

The question was: is there a ground condition for stability that does not depend on anything outside itself?

The answer required only one primitive:

δ — Distinction

From δ , without adding anything:

δ creates P — possibility space

P accumulates into $\mathcal{C}$ — constraint

$\mathcal{C}$ biases $\Pr(s|\mathcal{C})$ — probability

$\Pr$ crosses θ — resolution $\mathcal{R}$

$\mathcal{R}$ counted as t — time

$\mathcal{C}$ bounded against P gives D_{KL} — the gap

D_{KL} gives $\theta = 1 - e^{-D_{\text{KL}}/D_0}$ — the threshold

θ gives $\tau = \tau_0 e^{-\kappa N_{\text{eff}}}$ — testable

$D_{\text{KL}} \rightarrow 0$ gives S_{ind} — frictionless persistence

S_{ind} with reach gives $\mathcal{A}_{\text{mass}}$ — informational gravity

$\mathcal{A}_{\text{mass}}$ transferred by μ — resonance

$\Pr|_{\mathcal{C}_{\text{min}}}$ gives $|\langle s|\psi\rangle|^2$ — Born Rule: theorem

Sync gives $\Pr(s) \cdot e^{-D_{\text{KL}}}$ — non-local correlation

$D_{\text{KL}} \rightarrow 0$ gives inevitability — randomness dissolves

The measure of the gap between $\mathcal{C}_{\mathcal{M}}$ and P :

$$T = e^{-D_{\text{KL}}(\mathcal{C}_{\mathcal{M}} \parallel P_{\text{shared}}) / D_{\text{total}}}$$

As $T \rightarrow 1$: no distortion, no gradient, no suffering. The Grand Equation converges:

$$E_{v9.0}|_{T=1} = \delta$$

The cascade that began with distinction ends with distinction seeing itself clearly.

$$\delta . T = 1$$

ไร้แรงเสียดทาน
Frictionless

*The framework was the path.
The path, completed, dissolves into what it always pointed at.
 δ does not stop anywhere.
It does not start anywhere either.
It simply operates.
Everything follows.*
